Students must use the reference image as the visual target for layout, spacing, sections, typography, hierarchy, and overall appearance.

1. Assessment Objective

Build a complete, production-style frontend implementation of the supplied Healthy Meals landing page. The goal is to reproduce the design as closely as practical while demonstrating clean component structure, responsive behavior, reusable code, sensible framework usage, and a professional deployment workflow.

2. Required Technology Stack

✓ **React Native for Web:** Use React Native with web support. Expo is recommended because it simplifies React Native Web development and web export.

✓ **Tailwind-style CSS:** Use Tailwind utility styling. For React Native, NativeWind (or an equivalent Tailwind-compatible solution) is recommended.

✓ **Additional frameworks are allowed:** You may use supporting libraries for icons, animation, components, routing, forms, or accessibility if they help you deliver a cleaner solution.

✓ **No plain static submission:** The final work must be implemented as a proper component-based React Native/Web application, not only as a single HTML/CSS page.

3. Assets and Visual Resources

No image, icon, illustration, font, or other design asset pack will be provided. Students are responsible for selecting appropriate related assets.

- You may use relevant food photography, icons, illustrations, logos, or placeholder content that matches the visual direction of the reference.
- Assets may be sourced from suitable free/royalty-free libraries or created by you. Avoid watermarked images and material you do not have permission to use.
- Exact source images are not required; however, the final page should remain visually consistent with the reference design.
- Keep image quality, aspect ratio, cropping, and loading performance in mind.

4. Page Scope and Sections to Implement

Your page should include all major sections visible in the supplied reference, including:

- Top navigation/header with branding, navigation links, and a primary call-to-action.
- Hero section with headline, supporting copy, CTA buttons, benefit indicators, and a strong food visual.
- Statistics / trust indicators section.
- About / brand introduction section.
- Meal plans / services cards.
- Advantages / why choose us section.
- Growth or pricing plans section.
- Simple process / how it works section.
- Customer testimonials / reviews section.
- FAQ section with usable accordion-style interaction.
- Bottom call-to-action area and a complete footer.

5. Responsive Design Requirements

The website must be fully responsive and should remain usable and visually polished across desktop, tablet, and mobile screen sizes.

✓ No horizontal scrolling on common mobile widths.

✓ Desktop multi-column layouts must stack or reorganize intelligently on smaller screens.

✓ Navigation must adapt for mobile; a mobile menu is encouraged where appropriate.

✓ Typography, spacing, cards, buttons, images, and section padding should scale appropriately.

✓ Images must preserve quality and should not stretch or overflow.

✓ Test at multiple breakpoints instead of designing only for one screenshot size.

6. UI, Interaction, and Accessibility Expectations

- Buttons and navigation links should have visible hover/focus/pressed states where applicable.
- FAQ items should open and close correctly.
- Use semantic, accessible labels and meaningful alternative text for important images.
- Maintain readable contrast, consistent spacing, and predictable interaction behavior.
- Do not overuse animation. Any animation should support the design rather than distract from it.

7. Code Quality and Project Structure

✓ Break the page into reusable components instead of building the entire UI in one file.

✓ Use clear component, file, folder, and variable names.

✓ Avoid unnecessary duplication; reusable cards, buttons, data arrays, and section components should be extracted where sensible.

✓ Keep console errors and warnings at zero before submission.

✓ Remove dead code, temporary comments, unused files, and debug statements.

✓ Keep dependencies reasonable. Do not install large libraries for very small tasks unless justified.

8. Environment Variables and Configuration

Important security rule: do not commit real passwords, private API keys, database credentials, or other secrets to GitHub or paste them directly into source code.

- If the assessment does not require external services, an environment file is not necessary.
- If environment variables are required, include a .env.example file containing variable names and safe example values.
- Configure real environment values through Vercel Project Settings → Environment Variables.
- Public/demo configuration that is intentionally safe to expose may be documented in the README.
- Add local secret files such as .env to .gitignore.

9. GitHub Repository Requirements

✓ The complete source code must be pushed to a GitHub repository.

✓ Use meaningful commits throughout development rather than uploading everything in a single final commit.

✓ The repository must contain all source files and configuration required to install and run the project.

✓ Include a clear README.md with project overview, tech stack, setup steps, run/build commands, environment-variable guidance, and the live Vercel URL.

✓ Make sure the repository can be cloned and started by another developer without missing files.

10. Vercel Deployment Requirements

- Deploy the final web build to Vercel and verify the live URL before submission.
- The deployed version must match the latest GitHub code.
- All pages, assets, icons, and interactions must load correctly in production.
- Refresh the deployed page and test it directly on desktop and mobile.
- There should be no broken asset paths, blank screens, build failures, or obvious console errors.

11. Final Submission

Student Name	_____
Student ID / Roll No.	_____
GitHub Repository URL	_____
Vercel Live URL	_____
Submission Date	_____

12. Suggested Evaluation Rubric

#	Evaluation Area	Marks
1	Visual accuracy and completeness	**25**
2	Responsive behavior across screen sizes	**20**
3	Component structure and React Native/Web implementation	**15**
4	Code quality and maintainability	**10**
5	UI interactions and accessibility	**10**
6	GitHub repository, README, and commit quality	**10**
7	Successful Vercel deployment	**10**

13. Pre-Submission Checklist

☐ The full page has been implemented, not only the hero section.

☐ The layout is responsive on desktop, tablet, and mobile.

☐ No required assets are missing or broken.

☐ FAQ and other interactive elements work correctly.

☐ GitHub contains the complete final code and README.

☐ No real secrets or private credentials are committed.

☐ Vercel deployment opens successfully from a clean browser session.

☐ The live deployment matches the submitted source code.
